Capstone Project: Customer Data Analysis (Insights)

- The shopping distribution by gender are 620 customers are female and 380 are male, with female customers representing the larger share of the shopping mall's customer base.
- The total quantity of products sold was 1853 to female customers and 1128 to male customers, indicating higher product sales among female customers.
- Female customers generated 60% of the total revenue, while male customers 39%, indicating that female customers generate a significantly higher share of revenue than male customers.
- The highest number of purchases, accounting for 517 customers, is observed for products priced below 250 TL, indicating a strong customer preference for lower-priced products. Customers are more inclined to purchase affordable products.
- The 36–45 age category accounts for the highest number of customer visits to the mall compared with all other age groups.
- Analysis of the sales data reveals that the 36-45 age group recorded the highest volume of product purchases, highlighting their strong purchasing power.
- Although the 36-45 age category recorded the highest volume of product purchases, the 56-65 age category generated the highest revenue, indicating that customers with this age category making higher-value transactions and contribute more significantly to overall revenue.
- The majority of customers prefer cash as their primary payment method, resulting in relatively lower usage of debit card or credit card. Therefore, offering discounts exclusively on debit card transactions may not be the most effective strategy for increasing sales or influencing customer purchasing behaviour.
